

- a) Means of establishing a baseline of network risk through a vulnerability study.
- b) Means of expressing computer-based technology investment risk in terms of common currency by estimating of at least one of the followings:
- (1) Number of people creating the risk.
  - (2) The policy that can be developed and enforced in this risk area.
  - (3) The value of the computer-based intellectual property available to this risk area.

#### **Abstract of the Disclosure**

A system to translate and express a company's e-business risk in dollars and to then compare investment alternatives in computer-based risk technology and risk insurance policy coverage to achieve the most favored risk management. This most favored risk management is a combination of computer-based risk technology and risk insurance policy coverage determined by the risk reduction potential of each type of investment. The system provides the means of comparing investment costs of risk prevention computer-based technology with one or more risk insurance policies.
